

Project Overview – Eldar Gljiva

I plan to develop a weather application that displays a 5-day forecast using the OpenWeather API. Users will access the application through a search bar, allowing them to input a specific city. The application will then provide users with essential weather information such as temperature, humidity and wind speed. Additionally, icons will be displayed to visually represent the weather conditions.

The desired outcome is to create a user-friendly and visually appealing interface that delivers accurate weather updates for users convenience. This application aims to be helpful for anyone needing a quick access to upcoming weather conditions.
